

Experiment class :

- implement serializable so individual experiment can be called in the edit Fragment

ExperimentList class:

- contains experiments
- Content view is populated with data in this class's getView() function

AddExperimentFragment class:

- Asks the user for data values to populate an individual experiment
- Success and failure buttons are implemented here (also in the EditExperimentFragment)

EditExperimentFragment class:

- takes pre-existing experiment values and populates the Edit Fragment
 - Uses serialization to call individual class to edit
- Then populates new data same way AddExperimentFragment does
